Daak

Hedera

Daak and Hedera: the tracks we enter, and what is built

Every booking is an x402 payment, and the pay rules run on Hedera with no Solidity

In 60 seconds

1. A shop's agent books a delivery by calling our API. It gets a 402 with the exact price, pays in our rupee token through the official facilitator, and retries. Nobody approves it.
2. The money sits in escrow. Each driver's advance is a token transfer the moment the next person confirms the handover, and the rest is one long-term scheduled transaction that executes itself after delivery unless the shop files a claim.
3. Every booking, handoff, check and payout is a message on one HCS topic, and the drivers' work records are recomputed from it.

Tracks

AI Agents That Pay (x402)
$3,000

No Solidity
$1,000

Daak enters three partners, the event's limit: Hedera, 0G and Arkiv (with Swarm).

What the track asks, and where Daak stands

An x402-protected endpoint settling on Hedera through a listed facilitator	POST /api/book answers 402 with the booking's exact price; settled in dINR through facilitator 0.0.9185802	Live
An agent completes a paid request with no human	Each shop's agent reads /.well-known/x402, books, pays and retries on its own	Live
Transaction id in the README, HashScan link in the video	KNP-3WAE9's settlement 0.0.9185802-1793986788-181264432 is in the README; the video still has to show it	In progress
Spending controls	Only dINR, at most Rs 2,000 a booking, only to Daak's account; a booking cap per hour	Live
Agent identity (HCS-14 or ERC-8004)	Both sides carry an HCS-14 UAID, checked against Hashgraph Online's SDK; the agent checks Daak's before paying	Live
HCS audit topic	Topic 0.0.11327109: every booking, handoff, check, payout and assistant question	Live
HTS settlement, custom fees that split revenue	dINR carries a 2% fractional custom fee that pays Daak at the network level	Live
Scheduled transactions	Holdbacks in one waitForExpiry schedule per delivery; a claim deletes it	Live

Agent Kit or Network MCP	Ask Daak, the operator's assistant, reads balances, HCS and transactions through the Agent Kit's query plugins	Live
A2A negotiation	Not built: the price is the published meter, so there is nothing to negotiate	Not built
No Solidity	Hedera JavaScript SDK only: HTS, HCS, scheduled transactions, mirror node	Live

Every piece, where it lives, and its proof

x402 booking	The 402 quotes the meter for the distance and the parcel's charged weight, plus a 12% booking fee `web/lib/x402.ts, web/app/api/book`	KNP-3WAE9 settlement, Rs 599.26
Catalogue discovery	/.well-known/x402 lists the endpoint, the meter and Daak's UAID; the agent reads it before paying `web/app/.well-known/x402`	
Per-shop agent accounts	A Hedera account per shop holding prepaid dINR, topped up when the shop pays by UPI (the UTR goes on the log) `web/lib/agent.ts`	Gupta Garments' agent
dINR, the rupee credit	An HTS token with a 2% fractional custom fee to Daak `web/scripts/setup-money.mts`	Token 0.0.11327356
Escrow and advances	The fee is locked in escrow; each driver gets 50, 70 or 90% of their stretch when the next person confirms `web/lib/split.ts`	Escrow 0.0.11327245
Holdbacks that release themselves	All held pay in one long-term scheduled transfer (waitForExpiry); no server sends it `web/lib/split.ts`	KNP-3WAE9, released itself at 00:34:05
Claims	Deleting the schedule; the responsible stop's held pay repays the shop, topped up from a protection pool `web/app/api/resolve`	Pool 0.0.11330722
The public log	One HCS topic; badges appear only as a 12-character hash `web/lib/hedera.ts`	Topic 0.0.11327109
HCS-14 identity	Daak's UAID published with its fields; each booking records the paying agent's verified UAID `web/lib/uaid.ts`	HCS message 56
Agent Kit	Ask Daak answers from Hedera and Daak's records, proposes actions as buttons a person confirms, and every question is audited on HCS `web/app/api/assistant`	

Mirror node	Balances, the escrow, schedules and the drivers' records `web/lib/payout.ts, web/lib/history.ts`

Honest limits

- Testnet only. On mainnet the rupee collections and escrow would sit with a licensed payment aggregator; dINR stays a credit, never a currency.
- The holdback window is 15 minutes for the demo (HOLDBACK_HOURS); production would hold it for a day or more.
- The UPI payout to a driver's bank is recorded by the operator with its UTR; a payout partner would do it automatically.

To ask the mentor

- Is a custom HTS token like dINR a good fit for x402 on mainnet, or do you expect USDC on Hedera?
- How long can a waitForExpiry schedule wait on mainnet, and what does it cost to hold many open at once?
- Would you score HCS-14 alone as agent identity, or should we also register an ERC-8004 identity?
- Is there a pattern you like for A2A negotiation where the price is a fixed public meter?
